

Finite State Automata

Kozen: Lectures 2 & 3

Hopcroft, Motwani & Ullmann: Chap 1 & 2

Decision Problem (yes or no questions)

e.g. Given a directed graph, constant k ,
Is there a path of length at most k ?

A : set of candidates, instances (e.g. \mathbb{N})
B : subset of A for which answer is yes (e.g. prime)
Given $x \in A$ to determine if $x \in B$

Automaton for (A, B)

A machine which can solve any given instance of
a decision problem (A, B)

return to same vertex

Test for eulerian # To do: give a proof

G is eulerian iff $\deg(v)$ is even and G is connected

Standard formulation of instances (finite set)

Encode each input as a string of alphabet (Σ)

Unary encoding of n : repeat "a" n times ($\Sigma = \{a\}$)
 \emptyset is empty string = \emptyset^n

Graph inputs e.g. adjacency list (notation)
 flatten into string encoding

e.g. $\Sigma = \{a\}$, $A = \{a^p \mid p \text{ is prime}\}$

$\Sigma = \{0, 1\}$, $x \in \Sigma^*$, # 0(x) = count of zeros,
1(x) = count of ones. $A = \{x \in \Sigma^* \mid \#\text{0}(x) = \#\text{1}(x)\}$
(# can be defined inductively again)

$A = \{x \in \Sigma^* \mid \exists i \in \mathbb{N} \text{ s.t. } x \text{ is binary rep of } 2^i\}$

$\Sigma = \{a, \dots, z\}$. palindromes are language

$\Sigma = \text{ASCII}$. valid C programs are language

Let $\Sigma = \{0, 1\}$. $A = \{0^n 1^n \mid n \geq 0\}$

Notation: $A = 0^n 1^n$ is equivalent notation

Operations on languages: 1. Usual algebra over sets

To do: coze chapter 2 (\cup, \cap, \sim) (same alphabet for
both languages)

2. Concatenation (forms a monoid over langs as well)

$L_1 \cdot L_2 = \{a \cdot b \mid a \in L_1, b \in L_2\}$

(languages can be infinite as Σ^* is infinite)
 e.g. {af | f is prime}

Props: $A \cdot (B \cup C) = A \cdot B \cup A \cdot C$

Instance of a problem: finite word

Todo: insert grammar here

Notation: x, y, z, \dots will denote words

$x \cdot y$ and xy is same thing

concatenation with alphabet forms monoid
 (S, \cdot) is a monoid if \cdot is associative and
there is an identity, i.e. semigroup with identity.
if every element has an inverse then group

$x^{n+1} = (x^n)x$ {recursive definition}

Structural induction is v. important

Defining length

$|x| : \Sigma^* \rightarrow \mathbb{N}$

$| \epsilon | = 0$

$|ua| = |u| + 1$

Language over $\Sigma = L(\Sigma) \subseteq \Sigma^*$

Language recognition problem: $x \in \Sigma^*$, does $x \in A$
(A is a language)

All computational decision problems can be encoded
as language recognition problems

e.g. $A_1 = \{x \in \{a, b\}^* \mid \#\text{a}(x) = \#\text{b}(x)\}$

1 counter program (inc, dec)

ques: Why is induction an axiom over structures,
and does it depend on the property of the structure?

1. Unique homomorphic extension theorem

A helper f^n which applied to
satisfy structural defn is unique
must satisfy
an underlying
inductive property

2. Free generation

elements of lang when measured as # f^n 's applied
(e.g. length = # power), so, number of f^n 's should
be unambiguous.

Short answer: Yes, it depends on the structure,
(works for context-free grammars)

Formal definition of automaton

$$\mathcal{Q} = \{S_1, S_2\}$$

$$\Sigma = \{a, b\}$$

$$q_0 = S_1$$

$$F = \{S_1\}$$

$$\delta = \{(S_1, a, S_1), (S_1, b, S_2), (S_2, b, S_2), (S_2, a, S_1)\}$$

(δ is a total function : defined on entire $\mathcal{Q} \times \Sigma$)

→ used in theorem about DFA

$$1. \mathcal{S}\text{-tuple method } (\mathcal{Q}, \Sigma, q_0, F, \delta)$$

2. Transition diagram

3. Transition table

eg.	alphabet	
	a	b
states	0 1 2 3 3F	1 0 1 2 3
final state has	3F	3
c next to it		

$q \xrightarrow{a} q'$ denotes $\delta(q, a) = q'$

- A run of DFA A on $x = a_0, a_1, \dots, a_{m-1}$ is a sequence of states q_0, q_1, \dots, q_m s.t. $q_i \xrightarrow{a_i} q_{i+1}$ for $0 \leq i \leq n-1$
- For a given word x , the DFA has a unique run
- A run is accepting if last state $q_n \in F$
- Syntax = just defn. Semantics = run, accepting word, etc. (doesn't mean anything)

Claim : $\forall x \in \text{PALIN}$, $\text{len}(x)$ is even

Basis : $\text{len}(\epsilon) = 0$

Induction : $\text{len}(\alpha_a(x)) = \text{len}(axa) = \text{len}(x) + 2$

$\text{len}(x)$ is even

Hence, $\text{len}(\alpha_a(x))$ is even

Exercise : Numbers in unary

Powers of 2 = { $\epsilon, aa, aaaa, \dots$ }

Numbers in binary

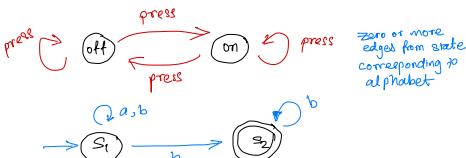

= { $1, 10, 100, \dots$ }

Binary num (with leading zeros) divisible by 3 (trivial, done in Korea)

mod 0, mod 1, mod 2
states for binary

Lecture 4

NFA

Lecture 3 (Generation of natural numbers)

(7/8/23)

Basis elements : 0

Constructor $S : \mathbb{N} \mapsto \mathbb{N} + 1$ (over \mathbb{N})

inductive/recursive p
defined

set should be "freely generated" (unique way of gen from basis)

Unique homomorphic extension theorem (UHET)

X_+ is a free set generated by $X(\text{basis})$ and f (functions),
for each fn $h : X \rightarrow B$ & single $\tilde{h} : X_+ \rightarrow B$ s.t.

$$\tilde{h} \circ x = h(x)$$

Overwords Universe = Σ^*

Basis = ϵ

(e.g. $\Sigma = \{a, b, c\}$) $\alpha_a : \Sigma^* \rightarrow \Sigma^*$ append a, b, c (constructor)
 $\alpha_b :$
 $\alpha_c :$

$$\boxed{\forall x \in \Sigma^* (p(x) \Rightarrow \forall_{a \in \Sigma} P(\alpha_a(x))) \text{ iff } \forall_{x \in \Sigma^*} P(x)}$$

Induction step

$$\text{len}(x)$$

Base step : $\text{len}(\epsilon) = 0$

$$\text{len}(\alpha_a(x)) = \text{len}(xa) = \text{len}(x) + 1$$

By UHET,
len is unique

$$\forall x \in \Sigma^*, \Sigma = \{a, b, c\} \quad (\text{even length palindromes})$$

Constructor Basis = ϵ

$$\forall_{x \in \Sigma} \alpha_a : x \mapsto axa$$

PALIN

Is NFA a machine?

(NFA-DFA construction)

Imp : Explicit construction for 2^n states

$$L = \{x \mid \exists u, v, x = uv, v \in \Sigma^+\}$$

$$= \Sigma^* \setminus \{z \in \Sigma^*\}$$

Claim : There is no DFA M with $m < 2^5$ and $L(M) = L(N)$

Proof : Assume to contrary, such an M exists.

for 2^5 paths, atleast two end up in the same state, then, extend them

so that one should be accepted, one rejected

Construct the paths as $(0, 1)^5$. Let two paths end up in same state, differ in first position, i,

$$\begin{array}{l} 0101100 \\ 0111000 \end{array}$$

now extend with $4-i$ zeros.

e.g. They must end up in the same state but one run is accepting and the other isn't

Lecture 5 (14/08/2023)

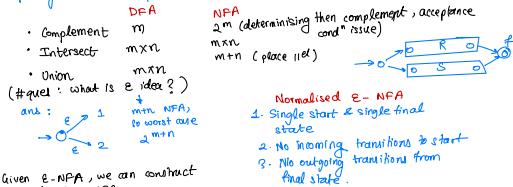

Quiz: 31/08/23 (Monday), 28/08: Doubt Solving
Syllabus: Up to minimization of DFA

$L_1 \cap L_2 : (\varnothing, \{q_2, \dots\})$ Final states if $q_1 \in F_1, q_2 \in F_2$

$L_1 \cup L_2 : (\varnothing, \{q_2, \dots\})$ if $q_1 \in F$, or $q_2 \in F$

$\sim L_1 : \text{final states are } \varnothing \setminus F$

Complexity of closure operations:

Given ϵ -NFA, we can construct normalised ϵ -NFA

N2

Proof: Any word accepted by ϵ -NFA is accepted by N_2 and vice versa. Easy to show.

(S, Σ , Δ_1, s_1, f_1) and $(N_1, \Sigma, \Delta_1, s_1, f_1)$ and $(N_2, \Sigma, \Delta_2, s_2, f_2)$ s.t. $L(N_1) = L(N_1) \cup L(N_2)$.

- $Q_1 = Q_1 \cup Q_2 \cup \{s_1, f_1\}$ fresh states s_2, f_2 .
- $\Delta_1(s_1, r) = \{s_1, s_2\}$, and $\forall a \in \Sigma, \Delta_1(s_2, a) = \varnothing$.
- $\forall s \in Q_1, \Delta_1(s, a) = \Delta_1(s, a)$ and $\forall s \in Q_2, \Delta_1(s, a) = \Delta_2(s, a)$.
- $\forall s \in Q_1 - \{f_1\}, \Delta_1(s, a) = \Delta_1(s, a)$, and $\forall s \in Q_2 - \{f_2\}, \Delta_1(s, a) = \Delta_2(s, a)$.
- $\Delta_1(f_1, r) = \Delta_1(f_1, r) \cup \{f_1\}$ and $\Delta_1(f_2, r) = \Delta_2(f_2, r) \cup \{f_2\}$

Proof: Given a DFA $BB = (Q, \Gamma, \delta, q_0, F)$ for B construct DFA AA for $W^{-1}(B)$
 $AA := (\varnothing, \Sigma, \delta', q_0, F')$ with $\delta'(q, a) = \hat{\delta}(q, wa)$
 Proof that this is correct follows from showing that accepted words are the same.

If $h: \Sigma^* \rightarrow \Gamma^*$ and $A \subseteq \Sigma^*$ is regular then $h(A) = \{h(x) | x \in A\}$ is also regular.

If h : replace string with chain of useless states!

Refer: Koenen for proof & homomorphism theorems.

Example: Let $x \in \Sigma^*, y \in \Sigma^*$
 $h_2(x) = y$ if hamming distance between $x, y \leq 3$, $|x| = |y|$

$h_2(A) = \{x \mid \text{bottom } ([x]) = y\}$

$h_2(A) = \{x \mid \text{bottom } ([x]) = y\}$

- If A is regular, $h_2(A)$ is regular as
- 1. Copy states of A 4 times
- 2. Have directed transitions for complement bits to copied DFA's.

Alternative: $\Sigma = \{[0], [1], [1], [1]\}$

$\text{top}([x]) = x$, bottom([x]) = y

say $x = 0010$, $\text{top}(x) = 01010$
 $\text{top}([x]) = 0011$, $\text{bottom}([x]) \leq 3$

$\mathcal{D}_2 \subseteq \Sigma^* = \{x \in \Sigma^* \mid d_{\text{ham}}(\text{top}(x), \text{bottom}(x)) \leq 3\}$

\mathcal{D}_2 is automaton for D_2 (easy to make)

Given $A \in \Sigma^*$, $H_3(A) = \text{bottom } (\text{top}^*(A) \cap D_3)$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$
 $\text{bottom } ([x]) = y$

$\text{top}^*(A) = \{x \mid \text{bottom } ([x]) = A\}$

ideas by constructing new edges = paths of length k to have first $\frac{1}{k+1} >$ last $\frac{1}{k+1}$, first $\frac{1}{k+1}$, last $\frac{1}{k+1}$.

$$\frac{1}{k+1}, \frac{1}{k+2}, \dots, \frac{1}{k+1}$$

- ϕ , No word matches. $L(\phi) = \emptyset$.
- a matches the single letter $a \in \Sigma$. $L(a) = \{a\}$
- ϵ Only empty word matches. $L(\epsilon) = \{\epsilon\}$.
- $\#$ Matches any letter from Σ . $L(\#) = \Sigma$
- \circledcirc Matches any word from Σ . $L(\circledcirc) = \Sigma^*$

We use operations like catenation, intersection on languages to get more complex patterns.

- $(\alpha + \beta)$. Union. $L((\alpha + \beta)) = L(\alpha) \cup L(\beta)$.
- $(\alpha \cdot \beta)$. Catenation. $L((\alpha \cdot \beta)) = L(\alpha) \cdot L(\beta)$. We will typically write $\alpha \cdot \beta$ as $\alpha\beta$.
- (α^*) . Kleene Closure. $L((\alpha^*)) = L(\alpha)^* = \bigcup_{n \geq 0} L(\alpha)^n$.
- Example: Compound Pattern $((a^*) \cdot b) + (b \cdot (a^*))$. Its language is what?
- $(\alpha \cap \beta)$. Intersection. $L((\alpha \cap \beta)) = L(\alpha) \cap L(\beta)$.
- $(\sim \alpha)$. Complement. $L(\sim \alpha) = \sim L(\alpha) = \Sigma^* - L(\alpha)$.

Redundant Operators

- Let $\Sigma = \{a_1, a_2, \dots, a_n\}$. Then $\# \equiv (a_1 + a_2 + \dots + a_n)$.
- $\circledcirc \equiv \#^*$.
- $\alpha \cap \beta \equiv \sim (\sim \alpha \cup \sim \beta)$.
- \sim is also redundant (difficult proof).

Regular Expressions

Pattern expresses without $\circledcirc, \#, \cap, \sim$. Abstract syntax: let α, β range over *RegExp*.

$$\alpha ::= a \mid \phi \mid \epsilon \mid \alpha \cdot \beta \mid \alpha + \beta \mid \alpha^*$$

Theorem

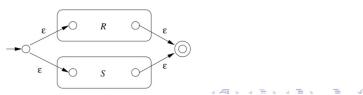

For every regular expression α we can construct a normalized ϵ -NFA $A(\alpha)$ such that $L(\alpha) = L(A(\alpha))$.

Proof (By structural induction). We construct the automaton bottom up.

- Normalized ϵ -NFA for a, ϵ, ϕ respectively.

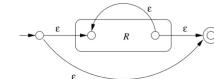

- For $\alpha + \beta$, inductively assume that we have normalized ϵ -NFA $A(\alpha)$ and $A(\beta)$. Construct union automaton recognizing $L(A(\alpha)) \cup L(A(\beta))$ as before.

- For $\alpha \cdot \beta$, inductively assume that we have normalized ϵ -NFA $A(\alpha)$ and $A(\beta)$. Construct catenation automaton recognizing $L(A(\alpha)) \cdot L(A(\beta))$ as before.

- For α^* , inductively assume that we have normalized ϵ -NFA $A(\alpha)$. Construct Kleene closure automaton recognizing $L(A(\alpha))^*$ as before.

- size of regular expression α counts number of atomic expressions and number of composition operators in α . This is denoted $|\alpha|$.

E.g. $|(a+b)^*aaa| = 10$ ($\circledcirc, ^*, +, a, b$) ≤ 5 vars

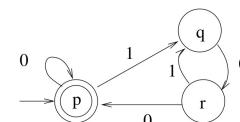

- Claim The size $|A(\alpha)| = O(|\alpha|)$. How? Prove by induction on the structure of regular expression α that $|A(\alpha)| \leq 2 * |\alpha|$.

- (Base step) For α equals $a \mid \phi \mid \epsilon$ check that $|A(\alpha)| \leq 2$.
- (Induction step 1) Let $\alpha = (\beta + \gamma)$.
 - $|A(\alpha)| = 2 + |A(\beta)| + |A(\gamma)|$ (const. $A(\alpha)$),
 - $\leq 2 + 2 * |\beta| + 2 * |\gamma|$, (ind. hyp.)
 - $= 2(|\alpha|)$. (defn of $|\alpha|$)
- Similar induction steps for $\beta \cdot \gamma$ and β^*

Theorem

For every NFA $A = (Q, \Sigma, \delta, I, F)$, we can construct a language equivalent regular expression $\text{reg}(A)$.

Construction Define regular expression $\alpha_{p,q}^{X,p}$ for $X \subseteq Q$ and $p, q \in Q$. This denotes set of words w such that A has a run on w from p to q where all intermediate states are from X . via some sort of DP

Example:

$$\alpha_{p,r}^q = 1 \cdot 0 \quad \alpha_{p,r}^{p,q} = 0^* \cdot 1 \cdot 0$$

Aim: To compute $\alpha_{p,p}^{p,q,r}$

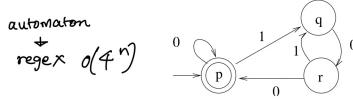

$\alpha_{p,r}^X$ can be recursively defined using the following rules:

- $\alpha_{p,r}^{\emptyset} = a_1 + \dots + a_k$ Δ cur NFA
where $r \in A(p, a_i)$ provided $p \neq r$
- $\alpha_{p,p}^{\emptyset} = a_1 + \dots + a_k + \epsilon$
where $p \in A(p, a_i)$
- For any $q \in X$,
 $\alpha_{p,r}^X = \alpha_{p,r}^{(X-\{q\})} + \alpha_{p,q}^{(X-\{q\})} \cdot \left(\alpha_{q,q}^{(X-\{q\})} \right)^* \cdot \alpha_{q,r}^{(X-\{q\})}$
in blue, didn't happen (ie exactly 2)

The desired regular expression is given as follows:

$$\sum_{p \in I} \sum_{q \in F} \alpha_{p,q}^Q$$

(proof follows this sketch under the claim that $\alpha_{p,q}^Q = \text{some language}$)

Compute $\alpha_{p,p}^{p,q,r}$ as

$$\alpha_{p,p}^{p,q,r} = \alpha_{p,p}^{p,r} + \alpha_{p,q}^{p,r} \cdot (\alpha_{q,q}^{p,r})^* \cdot \alpha_{q,p}^{p,r}$$

It is easy to see that

$$\begin{aligned}\alpha_{p,p}^{p,r} &= 0^*, & \alpha_{p,q}^{p,r} &= 0^* \cdot 1 \\ \alpha_{q,p}^{p,r} &= 00(0^*), & \alpha_{q,q}^{p,r} &= \epsilon + 01 + 00(0^*)1\end{aligned}$$

Hence $\alpha_{p,p}^{p,q,r}$
 $= 0^* + 0^*1 \cdot (\epsilon + 01 + 00(0^*)1)^* \cdot 00(0^*)$ every exp \Rightarrow a int exp

$$\alpha + (\beta + \gamma) \equiv (\alpha + \beta) + \gamma$$

$$\alpha + \beta \equiv \beta + \alpha$$

$$\alpha + \emptyset \equiv \alpha$$

$$\alpha + \alpha \equiv \alpha$$

$$\alpha(\beta\gamma) \equiv (\alpha\beta)\gamma$$

$$\epsilon\alpha \equiv \alpha\epsilon \equiv \alpha$$

$$\alpha(\beta + \gamma) \equiv \alpha\beta + \alpha\gamma$$

$$(\alpha + \beta)\gamma \equiv \alpha\gamma + \beta\gamma$$

$$\emptyset\alpha \equiv \alpha\emptyset \equiv \emptyset$$

$$\epsilon + \alpha\alpha^* \equiv \alpha^*$$

$$\epsilon + \alpha^*\alpha \equiv \alpha^*$$

$$\beta + \alpha\gamma \leq \gamma \Rightarrow \alpha^*\beta \leq \gamma$$

$$\beta + \gamma\alpha \leq \gamma \Rightarrow \beta\alpha^* \leq \gamma$$

laws are sound and complete

soundness : $\alpha \equiv_A B \Rightarrow L(\alpha) = L(B)$

completeness : $L(\alpha) = L(\beta) \Rightarrow \alpha \equiv_A \beta$

Useful Derived Identities

$$(\alpha\beta)^*\alpha \equiv \alpha(\beta\alpha)^*$$

$$(\alpha^*\beta)^*\alpha^* \equiv (\alpha + \beta)^*$$

$$\alpha^*(\beta\alpha^*)^* \equiv (\alpha + \beta)^*$$

$$(\epsilon + \alpha)^* \equiv \alpha^*$$

$$\alpha\alpha^* \equiv \alpha^*\alpha$$

SRE \rightarrow α

$|A(K)| = ?$

$$\begin{aligned}0^* + 0^*1(\epsilon + 00^*1)^*000^* & \\ \equiv 0^* + 0^*1(00^*1)^*000^* & \text{by (9.17)} \\ \equiv \epsilon + 00^* + 0^*10(0^*10)^*00^* & \text{by (9.10) and (9.14)} \\ \equiv \epsilon + (\epsilon + 0^*10(0^*10)^*00^*) & \text{by (9.8)} \\ \equiv \epsilon + (0^*10)^*00^* & \text{by (9.10)} \\ \equiv \epsilon + (0^*10)^*0^*0 & \text{by (9.18)} \\ \equiv \epsilon + (0 + 10)^*0 & \text{by (9.15).}\end{aligned}$$

Extended regular expression (ERE)
 $\alpha | \beta | \alpha[r_1+r_2] | r_1 \cdot r_2 | r^* | \overbrace{\alpha_1 \cap \alpha_2}^{\text{reg}} | \overbrace{r_1}^{\text{reg}} \rightarrow \text{DFA} \rightarrow \text{Reg} \rightarrow \text{Reg} \rightarrow \text{Reg}$
 "succinctness" : descriptive complexity

Given DFA $M = (Q, \Sigma, \delta, [q_0], F)$ and \approx as before, the Quotient

automaton is $M/\approx \stackrel{\text{def}}{=} (Q', \Sigma, \delta', [q_0], F')$, where

$$Q' = \{[p] \mid p \in Q\}$$

$$\delta'([p], a) = [\delta(p, a)]$$

$$F' = \{[f] \mid f \in F\}$$

Well-formedness

Lemma (Congruence) $p \approx q \Rightarrow \forall a \in \Sigma. \delta(p, a) \approx \delta(q, a)$.

Lemma $p \in F \Leftrightarrow [p] \in F'$

Lemma $\hat{\delta}'([p], x) = [\hat{\delta}(p, x)]$.

Proof: By structural induction on x ,

Algorithm [Hopcroft 1971]

- ➊ Make pairs table with $(p, q) \in Q \times Q$ and $p \leq q$. ✓
- ➋ Mark (p, q) if $p \in F \wedge q \notin F$ or vice versa. ✓ phase 1
- ➌ Repeat following steps until no change occurs.
 - ➍ Pick each unmarked state (p, q) .
 - ➎ If $(\delta(p, a), \delta(q, a))$ is marked for some $a \in \Sigma$ then mark (p, q) .
 - ➏ For each pair, $p \approx q$ iff (p, q) is unmarked.

Termination: In each pass at least one new pair must get marked.

Theorem (p, q) is marked

$$\begin{aligned}\text{iff } \exists x \in \Sigma^*. \hat{\delta}(p, x) \in F \wedge \hat{\delta}(q, x) \notin F \text{ or vice versa.} \\ \text{iff } p \not\approx q.\end{aligned}$$

We prove (p, q) is marked implies

$$\exists x \in \Sigma^*. \hat{\delta}(p, x) \in F \wedge \hat{\delta}(q, x) \notin F \text{ or vice versa.}$$

Proof: By Ind. on phase number

Base step: $p \vee q \Rightarrow \text{Sep}(\alpha_1, \alpha_2)$

Ind. step: $p \vee_{k+1} q \Rightarrow \exists q, p', q'. (p, q) \xrightarrow{\alpha_1} (p', q') \text{ and}$

$$q' \vee q$$

$$\begin{aligned}\exists y. \hat{\delta}(p', q) \in F \wedge \hat{\delta}(q, q') \notin F \text{ or } \\ \Rightarrow \hat{\delta}(p, q) \in F \wedge \hat{\delta}(q, q') \notin F \text{ or } W\end{aligned}$$

We prove $\exists x \in \Sigma^*. \hat{\delta}(p, x) \in F \wedge \hat{\delta}(q, x) \notin F$ or vice versa.

implies (p, q) is marked

Assume x separates (p, q) & x is shortest

Proof by Ind. on $|x|$

Base step: $x = \epsilon \Rightarrow p \vee q$

Ind. step: $(x - ay) \Rightarrow \hat{\delta}(p, ay) \in F \wedge \hat{\delta}(q, ay) \notin F \text{ or } W$

$$\Rightarrow \hat{\delta}(p, ay) \in F \wedge \hat{\delta}(\hat{\delta}(q, y), ay) \notin F \text{ or } W$$

$$\Rightarrow \hat{\delta}(p, ay) \wedge \hat{\delta}(q, ay) \text{ is marked}$$

ind. hyp

$\Rightarrow (p, q)$ gets marked in next phase

phase 2
